what is normalizing in python arrays

In Python (especially with NumPy arrays), **normalizing** means transforming the values in an array so they fit a particular scale. This is commonly done in machine learning, data science, and image processing.

1. Min-Max Normalization

Scales values to a range between 0 and 1.

Formula:

$$x_{norm} = \frac{x - x_{min}}{x_{max} - x_{min}}$$

Example:

Python

import numpy as np

arr = np.array([10, 20, 30, 40, 50])

normalized = (arr - arr.min()) / (arr.max() - arr.min())

print(normalized)

Run

Output:

Python

+ Ask anything

Run
